

Notes from the lecture: <https://www.gresham.ac.uk/watch-now/ai-humanity>

People like Marie Curie, Yo-Yo Ma, Lionel Messi: *Integration*

Processes versus *Practices*

Perception

Humans always predict what happens next; these predictions are modified by senses and past assumptions and experiences

AI's perception is like being trapped in Plato's Cave.

Assumption changes perception

AI training stops, while human's doesn't

AI only looks at the end product, it doesn't question its training data or attempt to learn more about it

Human memory is lived experience, while AI memory is just math.

AI is superficial, only a perception of reality.

LLMs predict just like humans

Our predictive systems help us survive and reduce surprises

Human and LLM memory

Working memory:

Humans can typically remember 4 chunks of information

Working memory is a short storage box. LLM can also lose track like humans, typically in the middle, start and end are prioritized over the middle

Humans can use one piece of information to reference previous knowledge

Semantic memory:

AI has semantic type knowledge but lacks real world memory like episode and emotional

AI connects words mathematically, but humans connect them with memories and concepts

AI is superficial, never engage, only look at a picture of the reality.

Sensory areas not just linguistic when predicting something.

- Difference: Larger working memory
- Similarity: how the working memory is used
- Human memory: rich web of info. (Semantic in AI)
